IgE Ranges kUa/l
< 0.10 = 0
0.10 – 0.34 = 0/1
0.35 – 0.69 = 1
0.70 – 3.49 = 2
3.50 – 17.49 = 3
17.50 – 49.99 = 4
50.00 – 99.99 = 5
> 100 = 6

Ranges are reflective of increasing concentrations of allergen specific IgE.

- In the interpretation of some food allergen test results, cross reactivity with other homologous food and/or environmental allergens can occur. The test findings should be interpreted in the context of the clinical findings and the individual's health history.

- Diagnostic features of an IgE-mediated allergy include sensitization to a specific allergen and an individual's clinical history of allergic symptoms on exposure to that allergen. A negative immunoassay laboratory test result especially in an individual with a strongly suggestive clinical and symptomatic history does not rule out allergy and further evaluation should be considered.
